

What ResQ does, and where investor money goes.

"Every second counts. Any phone. Any network." · Nigeria's community-powered emergency response infrastructure.

01 What the app actually does

IN ONE SENTENCE

ResQ turns any phone in Nigeria into an emergency call that finds the nearest trained responder and puts the whole rescue on a live government dashboard — in under 10 seconds.

1. A citizen needs help

Two ways in. **Feature phone** — dial *384*1#, pick Medical / Fire / Crime / Accident; USSD reply: "We'll call you back in a moment." **Smartphone / browser** — open the ResQ simulator and tap the red call button. Both paths end at the same dashboard.

2. The call connects

USSD path: ~3 seconds after the dial, ResQ rings the same phone back; the caller picks up and just talks. **Direct-call path:** the line opens silently from the start. The AI doesn't ask questions — it records what the caller says. No script, no menu, no panic-induced fumbling.

3. The AI does three things at once, while the caller is still speaking

Triage — severity score 1–10, type, recommended responder count. **Location extraction** — pulls "behind the big mosque on Aba Road" out of natural speech, geocodes it, drops a pin on the live map. **Urgency signals** — words like "bleeding" or "not breathing" auto-bump severity.

4. The dispatcher matches responders automatically

Filters every verified responder by skill (medical → doctors / nurses / paramedics; fire → wardens / civil defence). Ranks by Haversine distance within each responder's declared service radius. Pushes the alert to the **nearest 5 simultaneously**. First to tap **Accept** wins. **No human dispatcher exists in this loop.**

5. The government coordinator watches it happen

Live map with every incident colour-coded by type and shape-coded by status. Every responder pin moves in real time. Match lines literally draw between responder and incident. The call transcript appears live in the side panel. The coordinator can advance status, ring the caller back, or override the AI. **Every state change is timestamped and immutable** — the audit trail for the entire response.

6. The responder shows up, resolves the incident, the loop closes

Responder web view shows transcript, location, ETA controls. They mark *en-route* → *on-scene* → *resolved*. A monthly tally of completed incidents drives that responder's stipend.

THE POINT

Citizen, responder, and government were three islands. ResQ is the bridge — and it makes the bridge accountable.

02 Where investor money goes

A · Use of funds (where the raise is deployed)

The pitch ask is a 90-day Port Harcourt pilot. A realistic allocation for any size raise — same percentages whether ₦10M or ₦500M:

BUCKET	%	WHAT IT PAYS FOR
Responder stipend pool	30%	The visible promise. Monthly stipends for 100 verified responders during the pilot, performance-weighted. <i>The "money where your mouth is" line.</i>
Telco + aggregator licensing	15%	NCC fees, Africa's Talking / Termii setup, SMS / USSD per-session, voice minutes. Turns the sandbox into a real *384# shortcode.
Engineering	20%	Native iOS / Android apps, telco cell-tower-location MOU integration, public analytics dashboard, hardening for SEMA scale.
Responder recruitment + verification	10%	Credential checks (MDCN, NSCDC, NYSC), in-person verification visits, onboarding workshops in each LGA.
Government partnerships	10%	LGA / SEMA outreach, legal for the public-infrastructure framing, the data-sharing MOU template that scales to 774 LGAs.
Cloud + AI inference	5%	Vercel + Railway + Postgres + Redis + OpenRouter (Claude) + ElevenLabs voicemail minutes.
Awareness + community ops	5%	"Dial *384*1#" airtime campaigns on local radio, market-day demos, NYSC orientation visits.
Reserve	5%	Pilot overrun, incident response, legal contingencies.

70% of the raise visibly funds the network and infrastructure that go to citizens and responders. Only 20% is engineering. That's the right ratio for an infrastructure product — not a SaaS startup.

B · Money flows through the app (the unit economics)

How the platform sustains itself once the pilot lands.

↑ INFLOWS — WHO PAYS INTO THE PLATFORM

1. **State SEMA SaaS licence** (*primary, recurring*) — Each state pays a per-LGA monthly licence for the coordinator dashboard and audit trail. Tiered by population. *"Less than the cost of one ambulance per year, for every LGA in your state."*
2. **Corporate / NGO sponsorship** — A bank, telco, or oil major sponsors a named responder cohort ("MTN Lagos First Responders"); sponsor gets attribution on the responder profile and public analytics.
3. **Pay-per-incident reimbursement** (*Phase 3*) — Federal NEMA reimburses ResQ per verified incident handled. Same shape as how government reimburses private clinics under NHIS.

4. **Private-tier API access** — Private security firms, hospital chains, and gated estates pay for direct integration with the dispatcher.
5. **Phase-2 data products** — Anonymised, aggregated response-time data sold to insurance companies for actuarial models (consent-gated, NDPA-compliant).

↓ **OUTFLOWS — WHERE MONEY LEAVES**

1. **Responder stipends** (*largest line*) — Paid monthly via mobile money. Two components, both visible on each responder's profile:
 - A small **flat retainer** for being on-duty and accepting calls.
 - A **per-completed-incident bonus**, weighted by severity. Three "critical" cases pays more than three "low" cases.

Designed so the average part-time responder earns less than a single ambulance dispatch costs — but more than a typical NYSC stipend, so good people stay in the network.

2. **Telco / aggregator fees** — Per USSD session, per SMS confirmation, per voice minute. Goes to MTN / Airtel / 9mobile via the aggregator.
3. **AI inference** — Per-call charges to OpenRouter (Claude) and ElevenLabs (voicemail minutes).
4. **Hosting** — Small cloud bill (~5%).
5. **Ops team** — Coordinator support, responder verification staff, partnerships manager.

C · The investor pitch in one sentence

" You're not funding an app. You're funding the responder network that makes the app worth using. Every naira raised goes 70% into the public infrastructure — and once the SEMA licences land, the network funds itself. "

This line tells an investor four things at once:

- The money has a **visible destination** — not "engineering salaries".
- The unit economics get better as more LGAs sign on.
- The moat is the **responder graph + the audit trail**, not the code.
- **Government becomes the payer in steady state** — the model doesn't depend on retail willingness-to-pay.

ResQ — because every second counts. · Built for Nigeria. Ready for Africa.
