— PUBLIC EMERGENCY INFRASTRUCTURE

ResQ.

Every second counts. **Any phone. Any network.**

The dispatch interface 112 can run on. One number connects any Nigerian, on any phone, to the nearest trained responder in their neighbourhood. A government coordinator watches the whole rescue happen on a live map.

021

THE PROBLEM

112 has the mandate. It needs the rails.

Three gaps between the line a citizen dials and the help actually arriving.

01

112 is a phone number, not a dispatch system

The mandate exists. The modern dispatch layer to act on calls in seconds doesn't. Most LGAs have no integration at all.

02

Most phones can't run an app

Feature phones, prepaid SIMs, no data credit in the moment of crisis. An app-first emergency line only serves the wealthy.

03

Responders exist, invisibly

Off-duty doctors, nurses, NYSC corps members, fire wardens, vigilantes. The supply is already there. The system to find them is not.

WHAT RESQ IS

The interface **112** can run on.

A dispatch layer that sits between the line a citizen dials and the trained responders already nearby. Built so federal 112 and state SEMAs can plug in, not so they get replaced.

The Citizen

Calls from any phone. Knows nothing about how it works.

The Responder

Off-duty professional already on the street. One tap to accept.

The Coordinator

State or LGA dispatcher. Watches every incident live. Audits every outcome.

HOW A CALL REACHES US

One number. Every network.

A call to 112 — or a ResQ-licensed shortcode — lands on the same intake. The AI picks up, records what's happening, and dispatches help. No app, no menu, no data plan required.

✓ MTN ✓ AIRTEL ✓ GLO ✓ 9MOBILE

01

Dial the hotline

From any phone on any Nigerian network. Feature phone or smartphone, no difference.

02

Talk

The AI picks up silently and records. No script. No menu. The caller just says what's happening.

03

Help is on the way

The system locates the caller, extracts the situation, and dispatches the nearest verified responders.

📍 **Location comes from the call itself.** The telco hands us an approximate fix the moment the line connects (cell-tower triangulation), then the AI tightens it from what the caller says. The caller never has to read out coordinates or know where they are.

ⓘ Federal 112 routing and telco-location data pending NCC + MTN / Airtel MOUs. The intake, AI, and dispatcher pipeline run today against the Africa's Talking sandbox.

WHAT THE AI PULLS OUT

The caller talks. The system **listens** for three things.

01

Severity

A 1 to 10 triage score, the type of emergency, and how many responders to send.

02

Location

"Behind the big mosque on Aba Road" becomes a geocoded pin on the live map within seconds.

03

Urgency signals

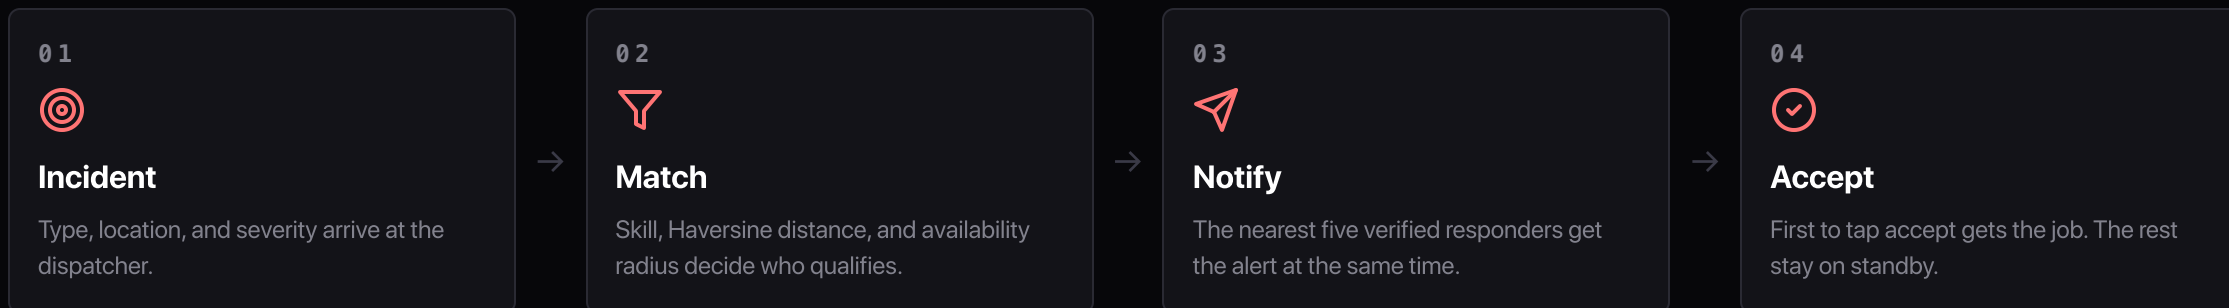

Words like "bleeding" or "not breathing" raise the severity and re-rank the dispatch.

“My dad, 67, chest pain, we are near Shoprite Lekki Phase 1.

Pin lands at Shoprite. Severity high. Two responders ranked by distance. **No human typed a word.**

HOW DISPATCH HAPPENS

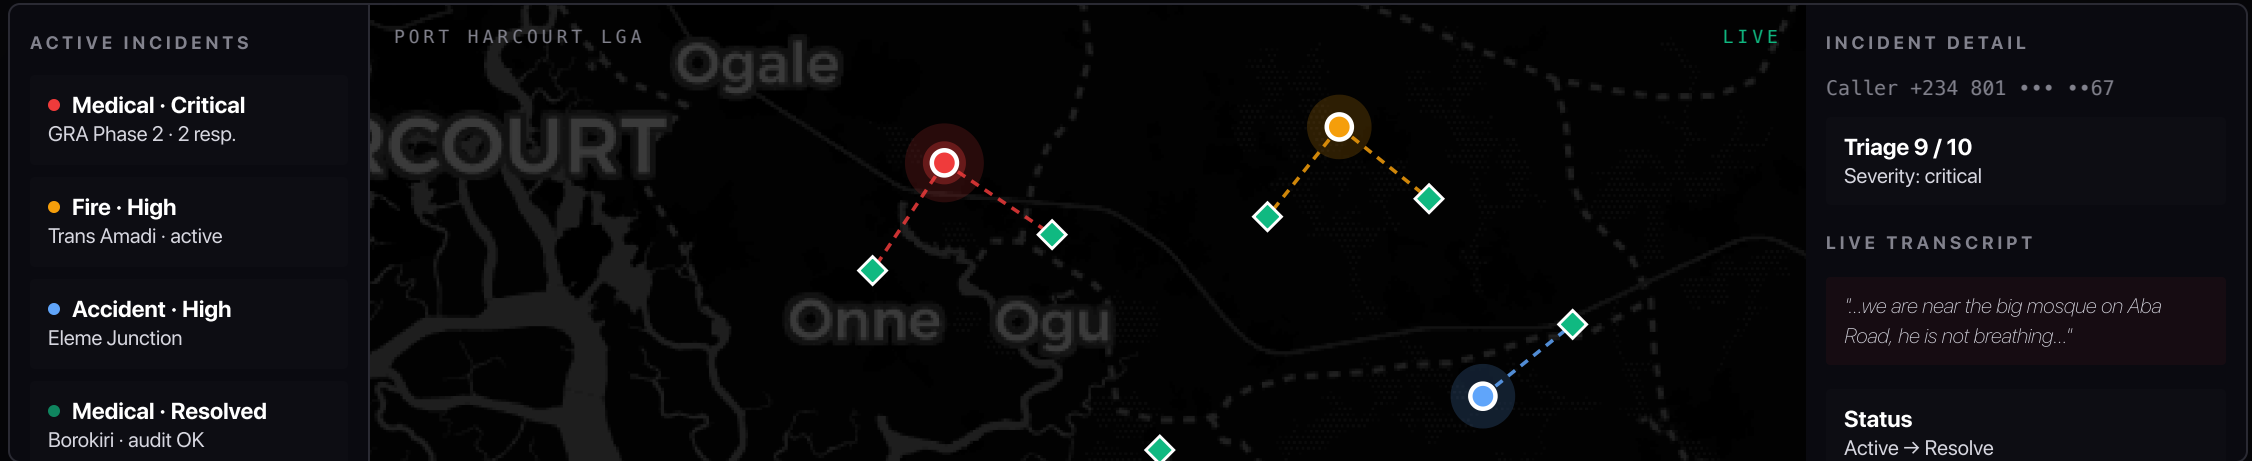

Four steps. **Zero humans** in the loop.

No dispatcher on the phone. No call queue. The matcher runs every time a location lands and on every status change.

THE COORDINATOR DASHBOARD

The government's **single screen**.

**One screen per LGA**

Every incident, every responder, every state change.

**Immutable audit trail**

Every transition timestamped. It cannot be edited.

**Response-time metrics**

Public accountability by LGA, by month.

POSITIONING

This is not a startup pitch. It is **public infrastructure.**

01

Universal access

Works on the cheapest phone in the country. No data, no app store, no digital divide.

02

Accountability built in

Every action audited by default. Response times become a metric, not a press release.

03

LGA-scalable

Same software for all 774 Local Government Areas. One configuration change per state.

04

Plugs into 112, doesn't replace it

An open dispatch interface federal 112 and state SEMAs adopt. Same emergency number citizens already know, working a hundred times faster behind the scenes.

UN SUSTAINABLE DEVELOPMENT GOALS

ResQ moves the needle on **six** SDGs.

Direct, measurable contribution. Not aspirational alignment.

SDG 03

Good Health & Well-Being

Cutting response time directly reduces avoidable deaths from cardiac arrest, road accidents, fires, and obstetric emergencies.

SDG 09

Industry & Infrastructure

Resilient public emergency rails built on telco infrastructure that already exists. No new hardware required.

SDG 10

Reduced Inequalities

One hotline, any phone, any network. The poorest Nigerian gets the same emergency line as the wealthiest.

SDG 11

Sustainable Cities & Communities

Communities become resilient when local responders are findable. Disaster response moves from hours to minutes.

SDG 16

Peace, Justice & Strong Institutions

An immutable audit trail makes government emergency response measurable, public, and enforceable.

SDG 17

Partnerships for the Goals

A public-private model. Telco aggregators, state SEMAs, community responders, AI partners. All on one rail.

THE RESPONDER NETWORK

Who actually responds, and **why they stay.**

The community itself. Already trained. Already on the street where the emergency happens.

**Off-duty doctors and nurses**

MDCN-verified, skill-tagged

**Fire wardens and civil defence**

Cross-checked against NSCDC records

**Security and police liaisons**

Includes registered vigilantes

**NYSC, FRSC, Red Cross first aiders**

Credentials uploaded at signup

**Recruitment**

Public sign-up on the ResQ site. Credential check. Verified flag. Activated in the matching pool.

**A modest monthly stipend**

Weighted by verified response activity. Performance-aligned. A part-time public service rather than volunteer burnout.

STATUS

The software is shipped. The licensing is the work ahead.

✓ BUILT AND RUNNING

SOFTWARE

- ✓ AI call intake (transcript and silent recording pipeline)
- ✓ Triage and location extraction from natural speech
- ✓ Skill and distance dispatcher with real-time push
- ✓ Coordinator dashboard with immutable audit trail
- ✓ Responder mobile view and live match lines
- ✓ USSD intake proven against the Africa's Talking sandbox

🔑 PENDING PARTNERSHIPS AND LICENSING

REGULATORY

- 🔑 Federal MOU to route 112 calls through ResQ
- 🔑 NCC USSD shortcode allocation (auxiliary entry)
- 📶 MTN and Airtel cell-tower triangulation MOU
- 📱 State SEMA integrations and rollout
- 📱 Native iOS and Android apps
- 📊 Public response-time analytics

THE ASK

Wire 112 onto ResQ rails

Federal MOU. One LGA pilot to start.

90-day Port Harcourt pilot

One LGA. 100 verified responders.

Publish the response-time lift

Before and after, the same 112 number.

ResQ.

*Every second counts. **Any phone. Any network.***
